Design Patterns

Façade

COMP3607 Object Oriented Programming II

Week 9

Outline

- Design Patterns
 - Façade

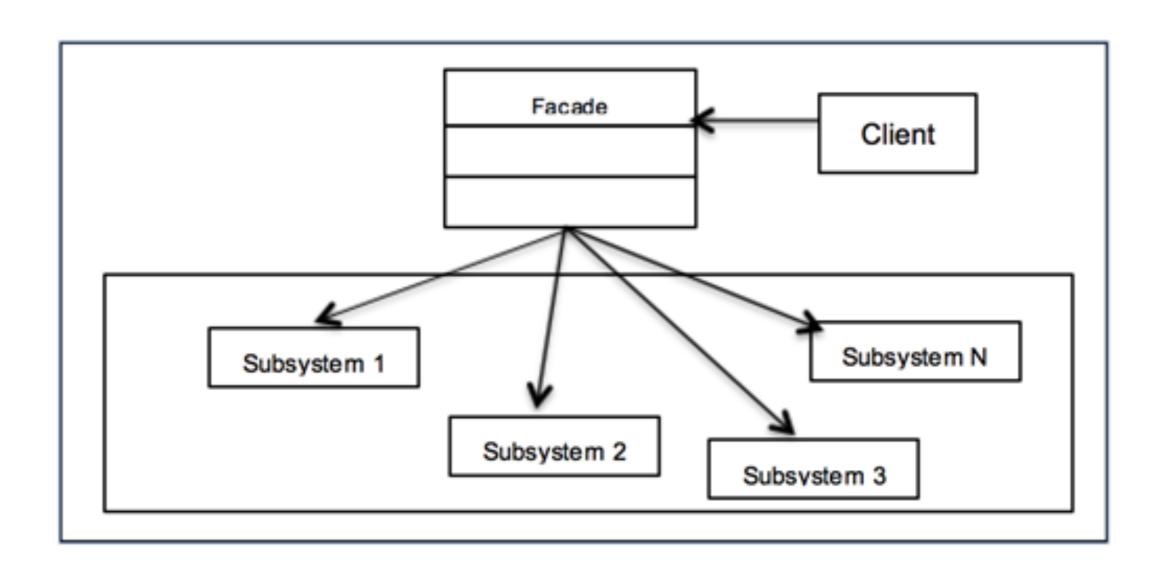

11

Façade Pattern: Intent

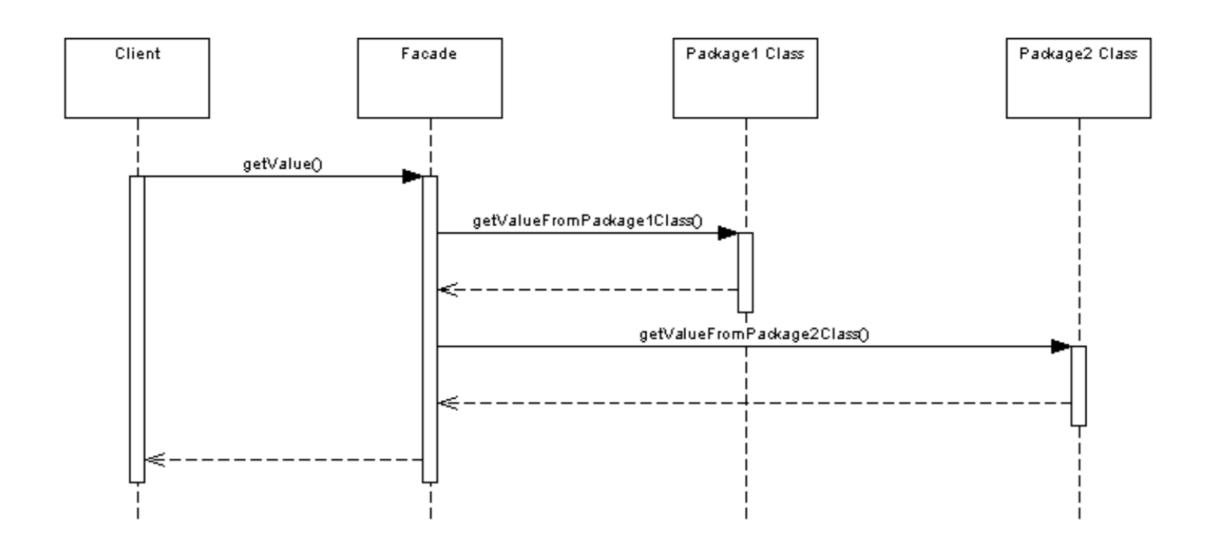

Facade defines a higher-level interface that makes the subsystem easier to use.

- Provides a unified interface to a set of interfaces in a subsystem.
- Wraps a complicated subsystem with a simpler interface.

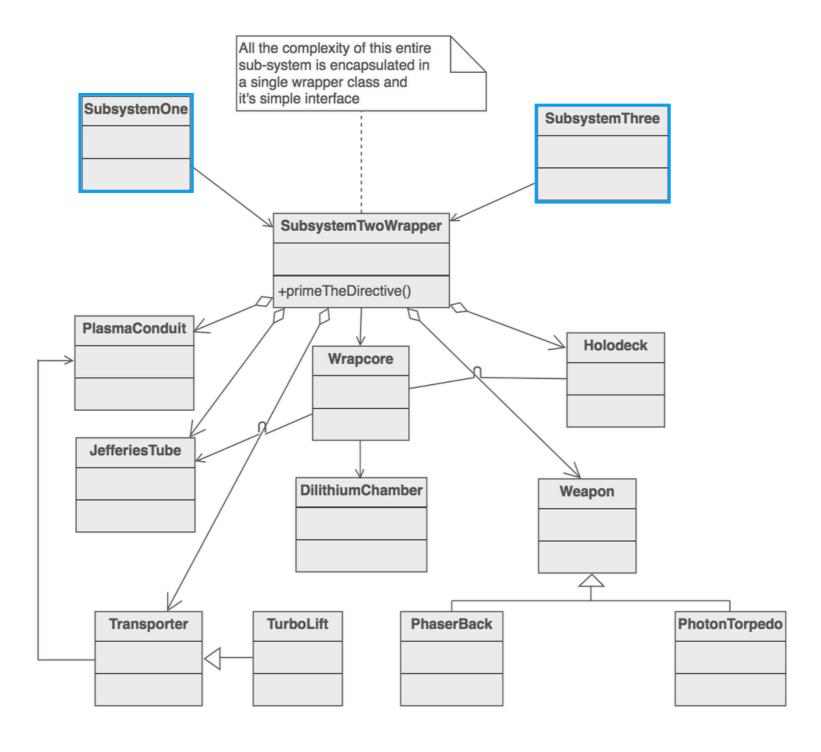

Façade Pattern

Façade Pattern

Façade Pattern: Example

SubsystemOne and
SubsystemThree do not
interact with the internal
components of
SubsystemTwo.

They use the SubsystemTwoWrapper "facade" (i.e. the higher level abstraction).

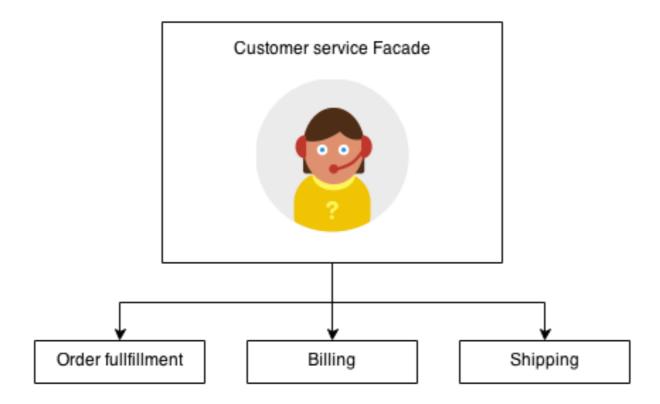

11

Façade Design Pattern

https://www.youtube.com/watch?v=B1Y8fcYrz5o (example code in Java) -Derek Banas

Example

The Facade defines a unified, higher level interface to a subsystem that makes it easier to use. Consumers encounter a Facade when ordering from a catalog. The consumer calls one number and speaks with a customer service representative. The customer service representative acts as a Facade, providing an interface to the order fulfillment department, the billing department, and the shipping department.

Example

Wrapper Class

Point

-pointCartesian: PointCartesian

- +Point (x,y)
- +move (x,y)
- +toString(): String
- +rotate (angle, Point)

Line

-origin: Point -end: Point

+Line (o: Point, e: Point)

- +move (x,y)
- +rotate (angle)
- +toString(): String

Client Class

PointCartesian

- -x: double
- -y: double

Subsystem 1

- +PointCartesian (x,y)
- +move (x,y)
- +toString(): String

PointPolar

- -radius: double
- -angle: double
- +PointPolar (radius, angle)
- +rotate (angle)
- +toString(): String

Subsystem 2

Applicability:

The Façade pattern is used:

- To simplify an interface
 - For example, service oriented architectures make use of the facade pattern.
 - A web service might provide access to a number of smaller services that have been hidden from the caller by the facade.
 - A typical pattern in OSGi bundles is to provide an interface package that is exposed to users of the bundle. All other packages are hidden from the user.

Adapter vs Façade

- Facade defines a new interface, whereas Adapter reuses an old interface.
- Remember that Adapter makes two existing interfaces work together as opposed to defining an entirely new one.

Adapter vs Façade

- Adapter and Facade are both wrappers; but they are different kinds of wrappers.
- The intent of Facade is to produce a simpler interface, and the intent of Adapter is to design to an existing interface.
- Facade routinely wraps multiple objects and Adapter wraps a single object.
- Facade could front-end a single complex object and Adapter could wrap several legacy objects.

Question:

So the way to tell the difference between the Adapter pattern and the Facade pattern is that the Adapter wraps one class and the Facade may represent many classes?

Answer:

No! Remember, the Adapter pattern <u>changes</u> the interface of one or more classes into one interface that a client is expecting.

While most textbook examples show the adapter adapting one class, you may need to adapt many classes to provide the interface a client is coded to.

Likewise, a Facade may <u>provide</u> a simplified interface to a single class with a very complex interface.

The difference between the two is not in terms of how many classes they "wrap", it is in their <u>intent</u>.
